October 2026

Title	Create two IAM Policies (Customer managed and Inline) for a user
Prerequisite	a test user with no prior permission
Policy1: Customer Managed Policy	a user should get S3 bucket all rights (there are about 476 difference actions for s3 bucket)
Policy2: Inline Policy	a user get only ec2.Describe* rights. That means he can not create/delete an EC2 Instance

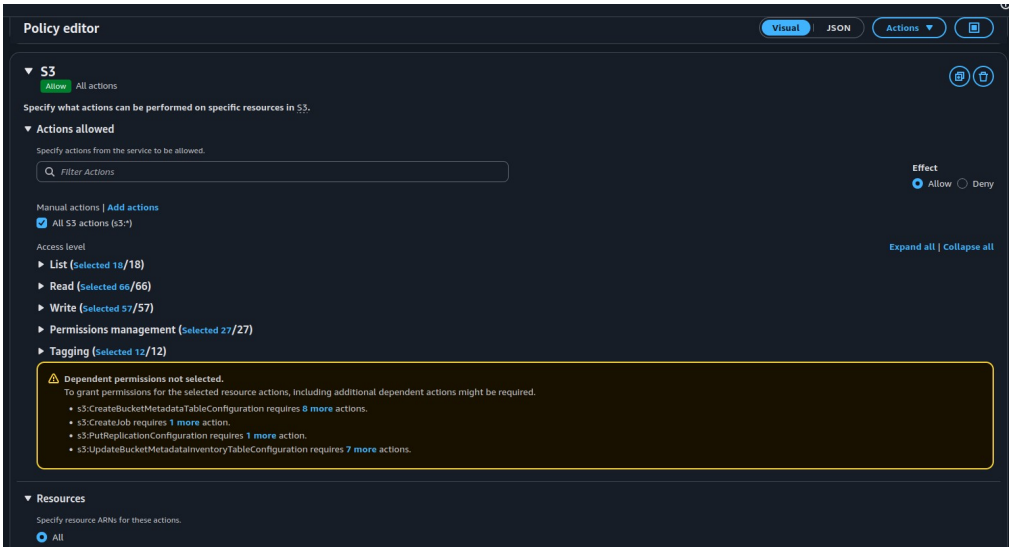

go to Policies and click on create policy

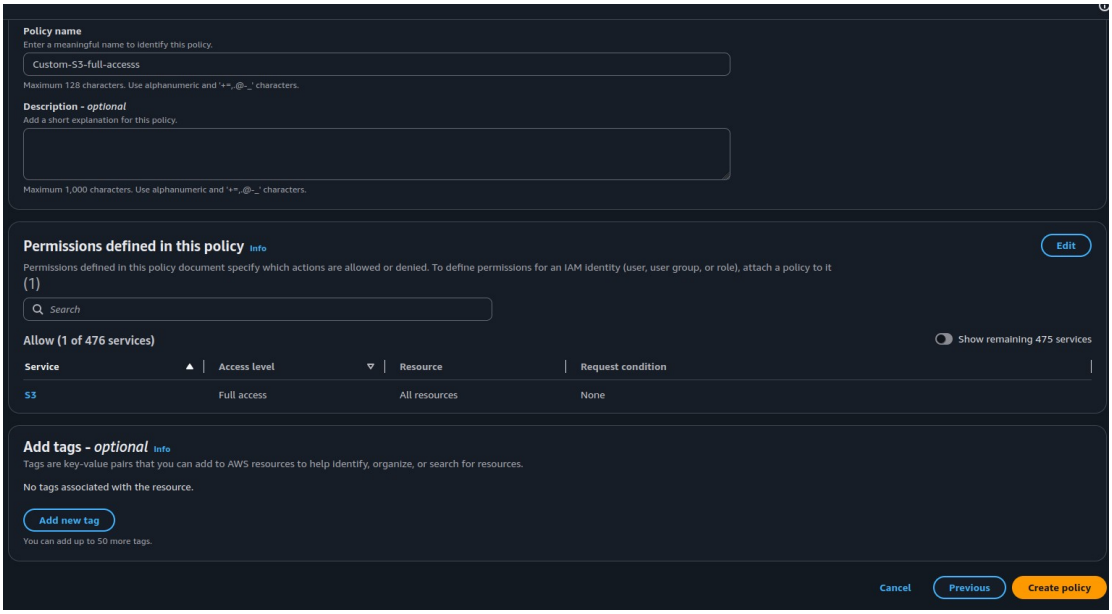

from select service, select s3

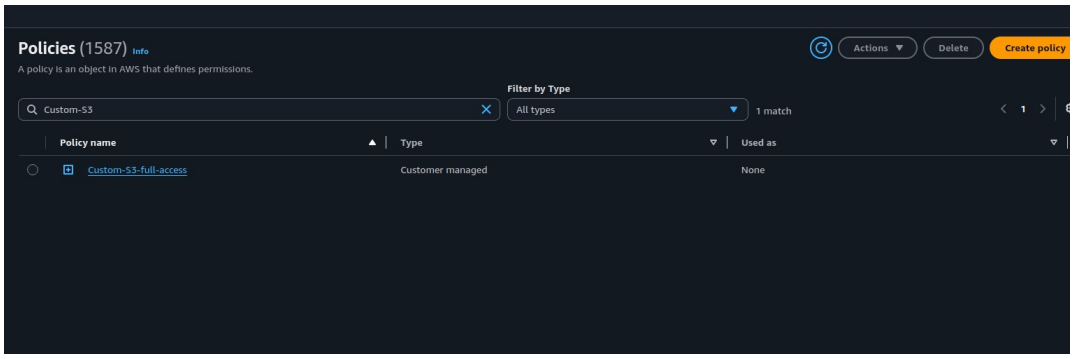

Select checkbox “All S3 actions(s3:*)
Effect: Allow
Resource: All
click next

give policy a name → select create policy button

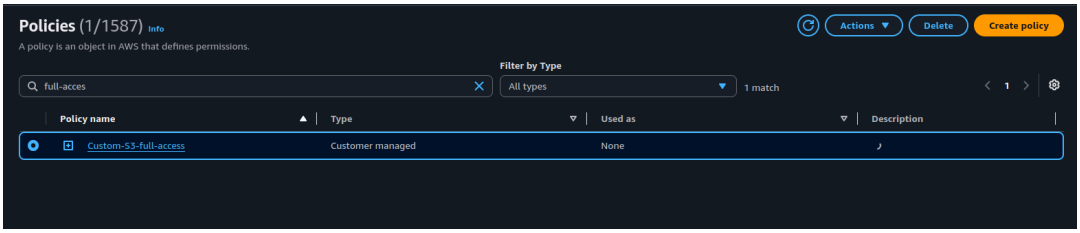

Now search this policy

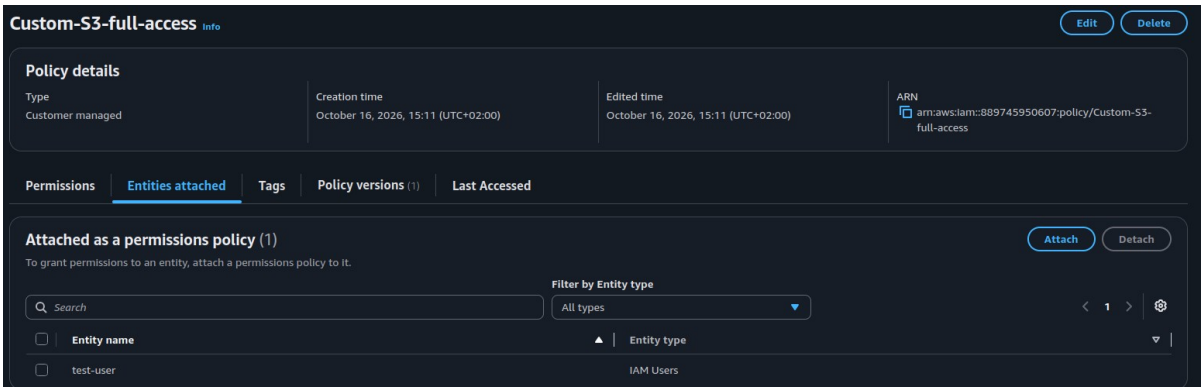

open the policy and click on JSON Button (right top)

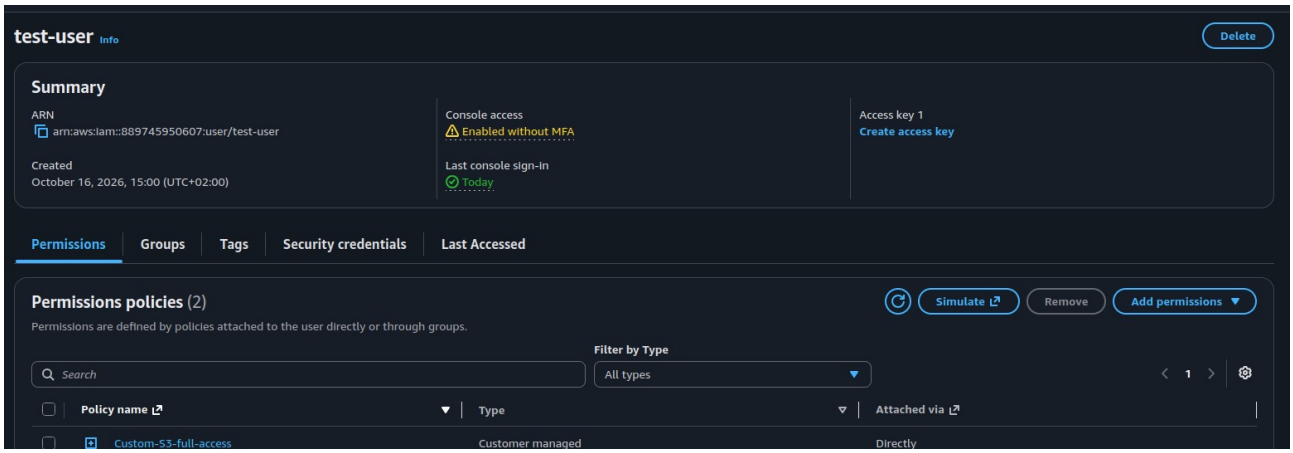

```
{
        "Version": "2012-10-17",
        "Statement": [
                {
                        "Sid": "VisualEditor0",
                        "Effect": "Allow",
                        "Action": "s3:*",
                        "Resource": "*"
                }
        ]
}
```

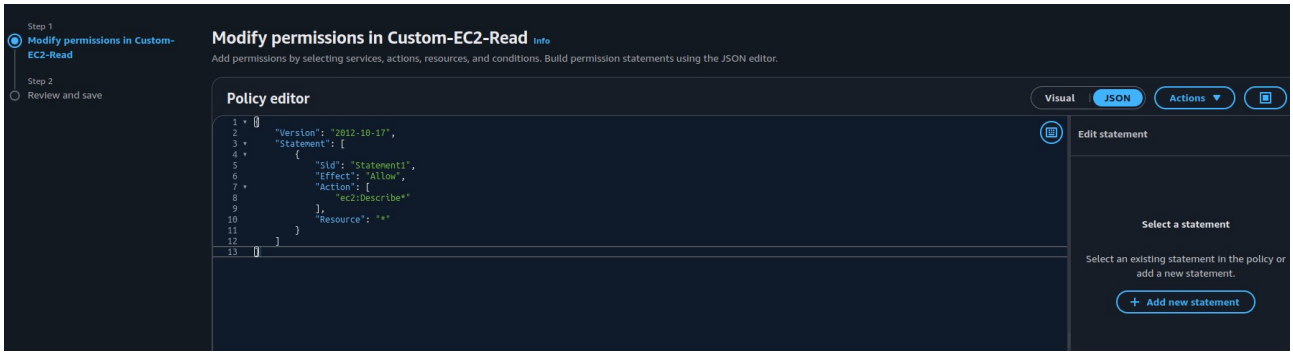

Now go to Policies → search this “Custom-S3-full-access” Policy. Select this Custom-S3-full-access policy radio button and open Action Button list and select “attach” and select test-user. Now this policy is attached to test-user

Now create one Inline Policy:
go to IAM User → test-user → Persmission → Add permission → Inline Policy → Policy Editor:

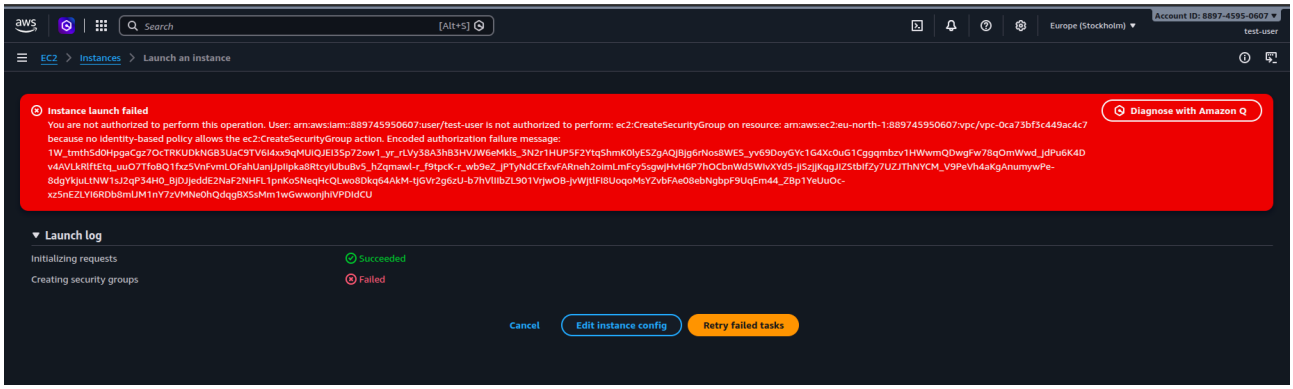

```
{
        "Version": "2012-10-17",
        "Statement": [
                {
                        "Sid": "Statement1",
                        "Effect": "Allow",
                        "Action": [
                                "ec2:Describe*"
                        ],
                        "Resource": "*"
                }
        ]
}
```

Now login with test-user and try:

1. create a bucket → [Expected Result] → test-user can create S3 Bucket
2. create a EC2 → [Expected Result] → test-user is not able to create ec2 instance

EC2 launch not allowed

S3 Bucket creation successful
